

# Holiday

---

## Provides:

This API provides a list of holiday data.

## Key Provisioning:

**Pain factor (0=ezipz...5=nightmare):** 

- Keys are only distributed to users, meaning that one must create an account in order to get a key.
- To get the URL, you must include three required parameters: key, country, and year.
- The URL contains optional parameters that allow the user to look for more specific holiday data

## Quotas:

- Free users are limited to historical holiday data.
- 

## The Good:

- Data is informing and easy to handle.
- If there is an error in the program, the status codes have been defined by the domain.
- Useful additional parameters to filter results

## The Bad:

- Doesn't allow free users to get current and/or future holiday data.
- More holidays included for some countries than others

## The Ugly:

- Data contains redundant parts: "date" and "observed date" info are equivalent
